                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27
                                                                                                                                                                                                                                                                                                          The present sequence is human glycosyl sulfotransferase-4alpha (GST-alpha) cDNA. GST-4 gene is found on chromosome 16q23.1.
GST is a type 2 membrane protein useful for inhibiting a binding evel between a selectin and a selectin ligand, which comprises contacting selectin with a non-sulphated selectin ligand, GST and a small molecular that inhibits the sulphation activity of GST. GST is also useful inhibiting a selectin mediated binding event

The present sequence is human glycosyl sulfotransferase-4alpha (GST-4 alpha) cDNA. GST-4 gene is found on chromosome 16q23.1.

GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, which comprises contacting the agent that inhibits the sulphation activity of GST and a small molecular agent that inhibits the sulphation activity of GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, sjogren's syndrome, Hashimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative colitis, syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection curing transplantation.
                                                                                                                       sulfotransferase-4alpha
                                                                                                                                                 ID NO:
                                                                                                                                                                                                                                                                                                                                                                                                  9-IS5

GST is a type 2 membrane protein useful for inhibiting a binding event extween a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, cystemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, sjogren's syndrome, Hashimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative colitis, distress canaemia, demyelinating diseases, cirrhosis, ulcerative colitis, syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection curing transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0

W severe combined immunodeficiency; malaria; autoimmune disorder; asthma;
W bone damage; cartilage damage; antiinflammatory disease; coagulation;
W thrombosis; contraceptive; ss. AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; nootropic; neuroprotective; vulnerary; cateopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antitinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antitihyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy concliberative disorders, neurodegenerative disorders, osteoarthritis, proliferative disorders, neurodegenerative disorders, severe condined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as a contraceptive. frame and peptides derived from open reading Novel nucleic acids and peptides derived from open reading useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -NO:3421 П SEQ sednence 5507pp; English. polynucleotide \mathbf{BP} 2988 99US-0127607. 99US-0127636. 99US-0127728. 2000US-0540763. 2000WO-US08621 entry) CDNA; 2597-2599; Leach M; CURAGEN CORP (first 2000-602362/57. GST-4 gene is found on chromosome 16q23.1.

CST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative colitis, syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection, charing transplantation.

The present sequence is mouse glycosyl sulforransferase-4 (GST-4) cDNA.

GST-4 gene is found on chromosome BEI.

GST is a type 2 membrane protein useful for inhibiting a binding event

between a selectin and a selectin ligand, which comprises contacting the

selectin with a non-sulphation activity of GST is also useful

in inhibiting a selectin mediated binding event. GST is useful in gene

therapy to treat disorders such as acute or chronic inflammation,

therapy to treat disorders such as acute or chronic inflammation,

systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis

nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes,

glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's

disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious

anaemia, demyelinating diseases, cirrhosis, ulcerative colitis,

dermatitis, myocarditis, regional enteritis, adult respiratory distress

syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis,

bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection

during transplantation.
                                                                                                                                                                                                                                                                        Ŋ

Claim 8; SEV 10 NO 2011.

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' and 3' ends of the cDNA consisted and nucleotide sequences of 5' and 3' ends of the cDNA construction of the protein encoded by construction of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length without any special methods. The present did not form part of the printed human cDNA of the invention.

                                                                                                                                                                                                                                                                                                                This sequence encodes the human glycosyl sulfotransferase-3 (GST-3) of the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies and methods are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            481

                                                                                                                                                                                                                                    administering antibody material that specifically binds betal, 3GnT, and/or a betal, 3GnT antisense nucleic acid molecule. L-selectin antagonis cand/or a betal, 3GnT antisense nucleic acid molecule. L-selectin sulfotransferase-2 (LSST-2) also directs MECA-79 antigen expression.

C Alternatively, the expression or activity of LSST-2 or its active fragment can be reduced in combination with reducing the expression or activity of betal, 3GnT. The method is useful for treating L-selectin mediated conditions such as Crohn's disease and ulcerative colitis, inflammatory disorders of the skin such as allergic contact dermatitis, psoriasis and Lichen planus, lymphomas, chronic pneumonia, delayed-type sequence represents cDNA encoding hyperplastic thurm.
                                                                                                                                                                                                                                                                                                                            such as allergic contact dermatitis, smas, chronic pneumonia, delayed-typess and hyperplastic thymus. This suman LSST-2.

The cwas isolated from gall bladder cDNA library GBLANOT01. TRNSFS-is expressed in dermatologic and gastrointestinal tissues, especially those associated with inflammation and cell proliferation. It shows homology to mouse N-acetylglucosamine 6-O-sulfotransferase. A polynucleotide comprising nucleotides 264-323 or 1272-1331 of the present sequence can be used as a I probe. The new human transferases and polynucleotides can be in the diagnosis, prevention and treatment (including gene ther

the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies and methods are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphocy

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

Primers for synthesising the function of the protein encother cDNA. The full length clones were obtained by construction length enriched cDNA libraries that were synthesised by the olimethod. The primers enable the production of the full length cD without any special methods. The present sequence was used as trepresentative sequence from a human clone which was used in homology searches to identify the clone.

Note: The sequence data for this patent did not form part of th specification, but was obtained in CD-ROM format directly from

The present sequence is human glycosyl sulfotransferase-4alpha (GST-4 alpha) cDNA. GST-4 gene is found on chromosome 16q23.1.

GST is a type 2 membrane protein useful for inhibiting a binding event selectin and a selectin ligand, which comprises contacting the between a selectin and selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphation activity of GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, of systemic lupus arythenia gravis, Sjogren's syndrome, Hashimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative colitis, anyocarditis, regional enteritis, adult respiratory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (page

The present sequence is human glycosyl sulfotransferase-4alpha (GST-4 alpha) cDNA. GST-4 gene is found on chromosome 16q23.1.

GST is a type 2 membrane protein useful for inhibiting a binding event cST is a type 2 membrane protein ligand, which comprises contacting the between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular gent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is also useful in inhibiting a selectin mediated binding event. GST is also useful in inhibiting a selectin mediated binding architis, polyarteritis, condosa, polymyositis, dermatomyositis, rheumatoid arthritis, polyarteritis, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious dermatitis, myocarditis, regional enteritis, adult respiratory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection during transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100

```
AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; cantipsoriatic; antiparkinsonian; nootropic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; cimmunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; cantidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating or the presence of or predisposition to, or preventing or treating nucleic acids can be used to express OREX proteins in gene therapy; concleic acids can be used to express OREX proteins in gene therapy; proliferative disorders, neurodegenerative disorders, osteoarthritis, proliferative disorders, neurodegenerative disorders, osteoarthritis, systemic lupus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                              ds and peptides

or 44 9 GSE and , GST-4beta application d sulfotransferases (GST)-4alpha and therapeutic agent screening glycosyl diagnostic

English 128pp; -104; 62 Page Ή.

٠Н genom (GST on erase-4 (is found is S £ gene sulfotrans GST-4 gene human glycosyl and GST-4beta. and present sequence is rencoding GST-4alpha a comosome 16q23.1. The present DNA encoding chromosome GST is a type

GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative colitis, dermatitis, myocarditis, regional enteritis, adult respiratory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection was a disingent and tissue rejection and tissue re

The present sequence is human glycosyl sulfotransferase-4beta (GST-4 beta) cDNA. GST-4 gene is found on chromosome 16q23.1.
GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene
                                                                                                                                                                                                                                    Human; glycosyl sulfotransferase-4beta; GST-4beta; immunosuppressive; therapy; selectin binding inhibitor; gene therapy; inflammation; systemic lupus erythematosus; SLE; rheumatoid arthritis; diabetes; polyarteritis nodosa; polymyositis; systemic sclerosis; dermatitis; glomerulonephritis; myasthenia gravis; Sjogren's syndrome; adrenalitis; Hashimoto's disease; Grave's disease; hypoparathyroidism; anaemia; demyelinating disease; cirrhosis; ulcerative colitis; allergic rhinitis myocarditis; adult respiratory distress syndrome; eczema; psoriasis; asthma; hypersensitivity; rheumatic fever; tissue rejection; asthma; hypersensitivity; ss.

```
of the invention are userul for assessing coxicity of test compounds and in gene therapy. Sequences of the invention are useful in the diagnosis, prevention and treatment of autoimmune/inflammatory of disorders such as acquired immune deficiency syndrome (AIDS), adult respiratory distress syndrome, allergies, anaemia, atherosclerosis, asthma, autoimmune haemolytic anaemia, contact dermatitis, Crohn's disease, flashimoto's thyroiditis, irritable bowel syndrome, multiple sclerosis, osteoarthritis, osteoporosis, psoriasis, systemic lupus erythematosus, rheumatoid arthritis, scleroderma, ulcerative colitis, uveitis, viral, bacterial, fungal, parasitic, protozoal, helminthic infections; cell proliferative disorders such as actinic keratosis, artherosclerosis, autherosclerosis, Duchenne and Becker dystrophy, hepatitis, Cushing's syndrome, cancers, myelodysplastic syndrome, epilepsy; endocrine disorders such as disorders of the hypothalamus and pituitary resulting from lesions such as primary brain tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               epliepsy; enuocitue aisolders cuch as primary brain tumours, and pituitary resulting from lesions such as primary brain tumours, adenomas, infarction associated with pregnancy, aneurysms, vascular malformations; eye disorders such as conjunctivitis, iritis, retinitis, glaucoma, pigmentosa; metabolic disorders such as Addison's disease, cystic fibrosis, diabetes, goitre, glycogen storage diseases, hypercholesterolaemia, hyperthyroidism, hypoglycaemia, lipid myopathies, hypercholesterolaemia, hyperthyroidism, hypoglycaemia, lipid myopathies, menkes syndrome, mannosidosis, obesity; gastrointestinal disorders such menkes syndrome, mannosidosis, obesity; mannosa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and developmental

The present sequence is mountained by the present sequence is mountained by the formulation useful for inhibiting a binding event serveen a selectin and a selectin ligand, which comprises contacting the between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular gent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis, nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, systemic sclerosis, diabetes, disease, darenalitis, hypoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative colitis, dermatitis, myocarditis, regional enteritis, adult respiratory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection during transplantation.

                                                                                                                                                                                                                                                                                                                                            ecul
                                                                                                                                                                                                                                                                                                                                         The present invention provides a method of modifying an acceptor molecul by contacting the acceptor with an isolated betal,3-N-acety1glucosaminyltransferase (betal,3GnT) or an active fragment, where betal,3GnT directs expression of a MECA-79 antigen. The invention also provides a method of treating or preventing an L-selectin-mediated condition by reducing the expression or activity of betal,3GnT that directs expression of a MECA-79 antigen. This can be do by administering to the subject an oligosaccharide L-selectin antagonist that inhibits binding of L-selectin to a MECA-79 antigen, for example by administering antibody material that specifically binds betal,3GnT, and/or a betal,3GnT antisense nucleic acid molecule. L-selectin sulformantively, the expression or activity of LSST-2 or its active fragment can be reduced in combination with reducing the expression or activity of betal,3GnT. The method is useful for treating L-selectin andiated conditions such as Crohn's disease and ulcerative colitis, inflammatory disorders of the skin such as allergic contact dermatitis, psoriasis and Lichen planus, lymphomas, chronic pneumonia, delayed-type hypersensitivity reactions, diabetes and hyperplastic thymus. This sequence represents cDNA encoding mouse I-GlcNAc6ST.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ~ O)

                                                                                                                                                                                                                                                                            clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' - and 3' -ends of the cDNA molecules have been determined. Primers for synthesising the full lengtles con determined. Primers for synthesising the full lengtles con clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-cappin method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length cDNA of the invention.

Note: The sequence data for this patent did not form navt of the specification.
                                                                                                                                                                                                                                    their

                                                   This sequence encodes the human glycosyl sulfotransferase-3 (GST-3) the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues the sequences, antibodies and methods are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphocito secondary lymph organs.

                                                                                                                                                                                                                                                       expression
betal, 3GnT that directs expression of a MECA-79 antigen. This can be administering to the subject an oligosaccharide L-selectin antage that inhibits binding of L-selectin to a MECA-79 antigen, for examply administering antibody material that specifically binds betal, 3GnT, and/or a betal, 3GnT antisense nucleic acid molecule. L-selectin and/or a betal, 3GnT antisense nucleic acid molecule. L-selectin sulfotransferase-2 (LSST-2) also directs MECA-79 antigen expression sulfotrantively, the expression or activity of LSST-2 or its active fragment can be reduced in combination with reducing the expression activity of betal, 3GnT. The method is useful for treating L-selectin mediated conditions such as Crohn's disease and ulcerative colitis, inflammatory disorders of the skin such as allergic contact dermating psoriasis and Lichen planus, lymphomas, chronic pneumonia, delayed-humaniatismit.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of cDNA clone 2617407CB1 encoding human transferase TRNSFS-11 (see AAY79219), 1 of 15 claimed human transferase proteins of the invention (see AAY79209-23). The clowas isolated from gall bladder cDNA library GBLANOT01. TRNSFS-11 is expressed in dermatologic and gastrointestinal tissues, especially those associated with inflammation and cell proliferation. It shows homology to mouse N-acetylglucosamine proliferation. It shows homology to mouse N-acetylglucosamine 6-0-sulfotransferase. A polynucleotide comprising nucleotides 264-323 or 1272-1331 of the present sequence can be used as a DNA

                                                                                                                                                                                                                                                                                                                                                This sequence encodes the mouse glycosyl sulfotransferase-3 (GST-3) of the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies and methods are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphocyte to secondary lymph organs.
